

Задача 1. M и N – множества из положительных чисел, $A = \sup M$, $B = \sup N$, R – множество всевозможных сумм $x+y$, где $x \in M$, $y \in N$. Докажите, что $\sup R = A + B$.

$$\text{Sup}(M) + \text{Sup}(N) = \text{Sup}(M+N)$$

$$\forall x [x \in M : A \geq x] \wedge \forall \epsilon [\epsilon > 0 : \exists x [x \in M : x > A - \epsilon]]$$

$$\forall y [y \in N : B \geq y] \wedge \forall \epsilon [\epsilon > 0 : \exists y [y \in N : y > B - \epsilon]]$$

$$\left(\forall x [x \in M : A \geq x] \wedge \forall y [y \in N : B \geq y] \right) \implies \forall x, y [x \in M \wedge y \in N : A + B \geq x + y]$$

$$\forall \epsilon [\epsilon > 0 : \exists x [x \in M : x > A - \epsilon]] \implies \forall \epsilon [\epsilon > 0 : \exists x [x \in M : x > A - \epsilon]]$$

$$\forall \epsilon [\epsilon > 0 : \exists y [y \in N : y > B - \epsilon]] \implies \forall \epsilon [\epsilon > 0 : \exists y [y \in N : y > B - \epsilon]]$$

$$\implies \forall \epsilon [\epsilon > 0 : \exists y, x [y \in N \wedge x \in M : y + x > A + B - \epsilon]]$$
